User documentation for E-Space Solution System

E-Space Solution Database System: This will provide the necessary support to E-Space Solutions Pvt. for an effective and efficient handling of the Mars coloni project. The system will give the user the capability to store and manage significant information regarding colonists, dependents, E-Jets, trips, house assignments, and job roles.

The process begins with the user logging in with their credentials to enter the dashboard. A Data Entry Operator is allowed to add and update the details of the colonists, their dependents, and their job assignments. Pilots can view trip schedules, passenger lists, and E-Jet details. An Administrator manages all functions: scheduling trips, assigning housing, and report generation. It grants the ability to assign specific trips for colonists and attribute housing accordingly to family size and shared accommodations. It is job-compatible; a colonist can indicate his or her qualifications. All these errors/technical oversight can be sorted out with the help desk either via an email at or by dialing. Data management is thus smooth and hence effectiveness of the effort to colonize Mars.

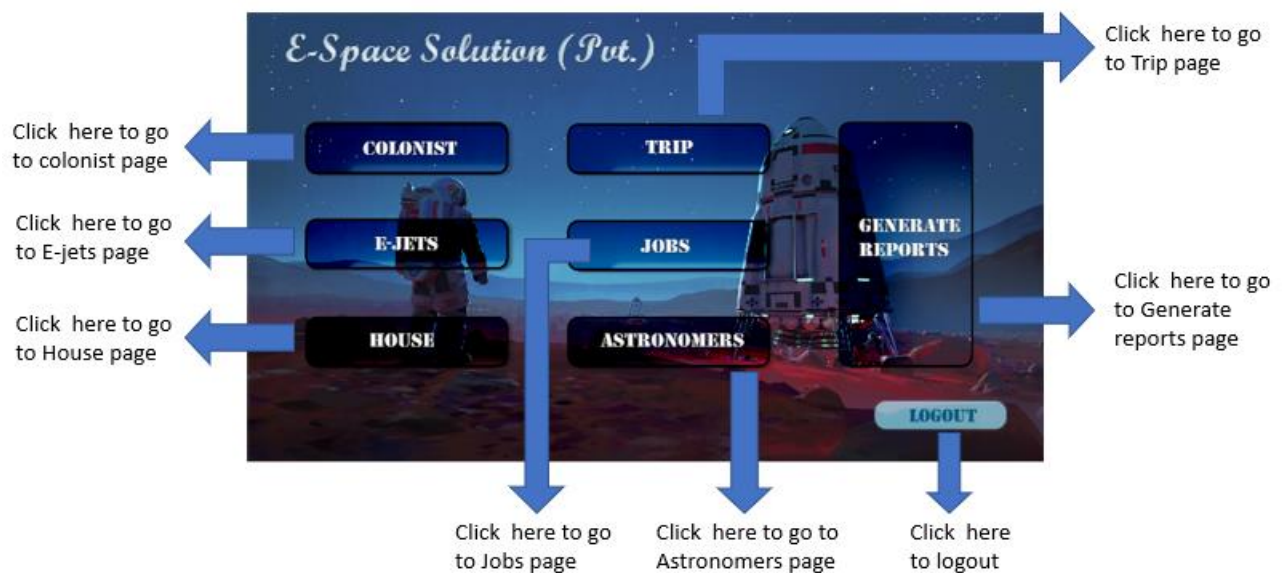

Login form

The Login Page is used for user authentication. It allows users to enter their credentials (username and password) to access the system securely. This ensures that only authorized users can access the system's features and data.

User documentation for Dashboard

The Dashboard Page serves as a centralized hub for monitoring, analyzing, and interpreting key information, metrics, and data points. It provides an overview of important data in a visually appealing and easily understandable manner. This allows users to make better, more informed, data-driven decisions by quickly accessing and understanding critical information.

Management data

The Insert, Update, Delete, and Search functionalities are essential for managing data within the E-Space solution system. **Insert** allows users to add new records or data entries into the system, such as adding a new colonist, e-jet, or trip. **Update** enables users to modify existing records, which is useful for correcting or updating information, like changing a pilot's qualification details. **Delete** allows users to remove records from the system, helping to maintain data accuracy and relevance by eliminating outdated or incorrect entries. **Search** provides users with the ability to find specific records based on various criteria, which is crucial for quickly locating information, such as finding a particular house or job assignment. These operations ensure that the system's data remains current, accurate, and easily accessible.
